

Health Expenditure & COVID-19

Problem

I tend to find out to what extent will health expenditure influence the Covid-19 testing rate in order to provide some analyse for medical agencies

Question

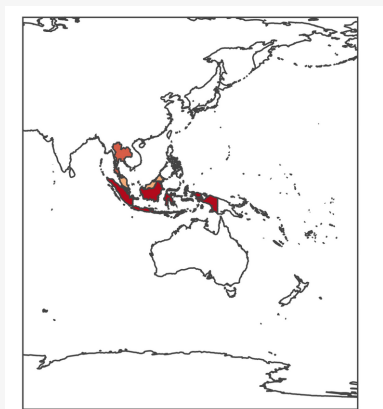

Health Expenditure and Testing Rates: Does higher medical input lead to higher coronavirus testing rates?

Data sources

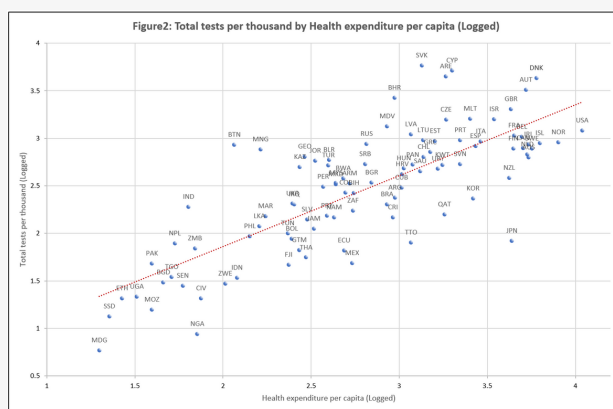

I will use the data of testing rates from Our World in Data and the data of domestic health expenditure per capita in 2019 (US\$) from the World Development Indicators.

Figure 1 COronavirus testing rates among the world

Less developed areas tend to spend less on health care(I've used the map from the class because I'm still working on how to make the map)

Figure 2. The effect of health expenditure on cross-national Coronavirus testing rates

there is positive relationship between health expenditure per capita and coronavirus testing rates
